Welcome [John](#) | [Logout](#)**hy-per-lip-id-emia** (hi " pər-lip " ĭ-de´me-ə) 

a general term for elevated concentrations of any or all of the [lipids](#) in the plasma, such as [hypertriglyceridemia](#), [hypercholesterolemia](#), and so on. See also table of [hyperlipoproteinemias](#). Called also [hyperlipemia](#), [lipemia](#), and [lipidemia](#).

hyperlipidemic, adj

combined hyperlipidemia, a generic designation for a hyperlipidemia in which several classes of lipids are elevated; usually used to denote the phenotype of a type II-b hyperlipoproteinemia. See table of [hyperlipoproteinemias](#).

familial combined hyperlipidemia, a genetically heterogeneous, autosomal dominant disorder of lipoprotein metabolism manifest in adulthood as either hypercholesterolemia (type II-a hyperlipoproteinemia phenotype), hypertriglyceridemia (type IV hyperlipoproteinemia phenotype), or a combination (type II-b hyperlipoproteinemia phenotype); different phenotypes may succeed each other in a single individual. The disorder is characterized by greatly elevated plasma apolipoprotein B and premature coronary atherosclerosis, but only occasionally xanthomas. Called also [multiple lipoprotein-type h](#). See also table of [hyperlipoproteinemias](#).

mixed hyperlipidemia, see under [hyperlipemia](#).

multiple lipoprotein-type hyperlipidemia, [familial combined h](#).

remnant hyperlipidemia, a [hyperlipoproteinemia](#) in which the accumulated lipoproteins are normally transient intermediates, chylomicron remnants, and intermediate density lipoproteins. See table of [hyperlipoproteinemias](#).
