[System Requirements](#)

Clean Slate, developed and manufactured in the United States, is designed to protect public access computers from malicious or inexperienced users. While not restricting users' activities, Clean Slate will scour drives back to their original state upon reboot or log off. Clean Slate takes only minutes to install and needs no attention, ever, for most installations. Clean Slate restores the computer to its original configuration discarding unwanted user changes: including erased files, installed software, downloaded spyware and adware, downloaded viruses and Trojan horses, and altered icons.

Accommodates Windows Updates while Secure

Without requiring any effort from the administrator, Clean Slate automatically accommodates Windows Updates. No need for complicated scripting, scheduling of downtime, and leaving computers on overnight. It just works! These Windows Critical Updates are vital to protect not only the computer being updated, but also other computers connected with this computer throughout the local network and beyond. Clean Slate makes it easy to be a responsible Internet citizen by keeping all of your computers updated with the latest security patches. Again it requires nothing of you but to install Clean Slate.

 **Tip:** Clean Slate not only clears unwanted changes, it also blocks unfamiliar executables from running.

Allows software deployment tools like Microsoft® SCCM, Altiris® and LANDesk®

Clean Slate allows for automated remote software deployment and maintenance while maintaining a secure computing experience. Use any third party deployment tool while Clean Slate security is active. Your computers are never left vulnerable.

Products with broadly similar characteristics to Clean Slate lack the flexibility and the technology to accommodate this non-trivial need. They require that the security be taken down every time any routine maintenance task needs to be performed, creating unacceptable vulnerabilities, inviting unascertainable threats, and interrupting lab availability. Clean Slate, with a simple configuration, works smoothly with third party deployment tools.

With this important benefit, Clean Slate allows computer maintenance tasks to be performed without the need to remove students from computers or disable security on computers.

Why We're Better

- Support for Windows 8.1/8/7
- Discards unwanted changes to desktop, programs, and documents at log off and reboot
- No annual maintenance fee
- Windows Updates run automatically while security is active
- Antivirus Updates run automatically while security is active
- Blocks unwanted executables from running
- Allows the use of third party software deployment tools like Microsoft® SCCM, Altiris® and LANDesk® while security is active
- Protects against malicious file patching
- Quickly disable or enable security, no need to reboot
- No need to partition the hard drive, ever
- Disable, enable, and alter security on the fly, no need to reboot
- Can allow permanent saves by folder, file, or registry key
- Blocks unwanted programs from running
- Protects privacy by clearing all Internet activity
- Your computers are safe from unwanted programs and files being used and installed from removable media and remote drives
- As the administrator, you can view the changes and save selected changes permanently

At a Glance

Accommodates finicky and security averse programs

The effortless configuration Clean Slate offers is ideal. Clean Slate can automatically configure many applications that require special attention, easing administration. A number of applications, typically legacy antivirus types, do not treat the file system in a way that is compatible with the default configuration of Clean Slate. Clean Slate will look for these known applications and make special accommodation so the applications can function as designed while Clean Slate security is active. Nothing is required of you but to install Clean Slate.

Protection from rogue administrators

Clean Slate protects from rogue administrators. All of the security features can be applied to local system administrators and domain administrators, too. Normally, administrators have unrestricted access to a computer. Clean Slate changes this, and allows enforceable restrictions on administrators' activities.

Blocks execution of any program

Clean Slate security goes beyond just clearing unwanted changes. You can also block programs from running. Clean Slate reads and lists all the programs in your start menu. While in the Clean Slate configuration screen, simply select the programs you want blocked. Once configured, the programs can not be accessed. Not only will Clean Slate block the execution of any presently installed programs but also unknown programs from the Internet and removable media (USB drives, CD ROM, network shares, floppy disks, etc.).

Allows permanent saves when wanted

Rated best nonrestrictive desktop security software, Clean Slate is easy yet powerful. Administrators, by password, can specify individual drives or directories not to be cleared by Clean Slate, allowing persistent changes in some areas on the disk.

Additionally, administrators can view all changes made and specify which changes should be undone on reboot or log off and which should be committed as permanent changes.

Did you know that Windows Critical and Antivirus Updates run normally with Clean Slate security active?

- Automatically removes unwanted downloads, software installations, and the effects of user mischief, including spyware and adware
- Complete security from malicious or inexperienced users
- Just log off or reboot to find the Windows desktop looking the same
- Automatically restores icons that users delete or hide and remove icon clutter that users add
- New software cannot be permanently installed without your authorization
- Clears all virus downloads
- Multiple levels of administrative access determined by user name and password
- If files have been renamed, deleted, or moved, just log off or reboot and everything is back to your configuration
- You can schedule to disable security by time of day
- Easily select individual files and folders to be free of security; this is ideal when permanent changes are desired
- Never worry about a user forgetting to log off the computer. Clean Slate will automatically log off, shut down, or restart the computer after a period of inactivity
- Works great with computer imaging software
- Ideal solution for public access computers
- Your computer will remain free from downloads and software installations, including spyware and adware
- Perfect for computer Kiosks

Allows antivirus signature updates

Compatible with all major antivirus software, Clean Slate is the ideal solution. Clean Slate, while the security is active, allows antivirus updates to install properly. Clean Slate will automatically configure your antivirus software. Once configured, all antivirus updates will install, effectively protecting your computers, without fear of the update being removed at log off or reboot.

Provides the perfect learning environment

Customizing any area of the computer to precisely accommodate your security need is quick and easy using wild cards and environment variables. In a computer programming environment, Clean Slate can allow students to save and test changes.

Protects your computers

Clean Slate actually prevents the original files from ever being modified. Instead, Clean Slate caches all unwanted changes in a special folder that is hidden and protected from the users. When the computer is rebooted or a user logs off, Clean Slate merely discards the cached changes.

Ideal security

Packed with features, Clean Slate provides impressive flexibility. The powerful security of Clean Slate discards all unwanted changes; plus, it is flexible allowing permanent saves where desired. Clean Slate has the ability to allow permanent saves by Registry key, file name, or folder. Any program can easily be configured to run without Clean Slate clearing changes. This is ideal to retain antivirus updates.

Central Control

Easy Remote Administration for your Fortres 101
& Clean Slate Clients

Central Control allows an administrator to configure all of the Clean Slate and Fortres 101 installations from one location. For more information on Central Control, click [here](#). With Central Control, each computer can have a scheduled time when Clean Slate security is disabled. Remotely disabling security on one or multiple computers, without having to reboot, makes maintaining your computers fast and easy.

Enhance Clean Slate security with [Central Control](#) network software.

- Control Clean Slate security settings over a network.

- Finicky and security averse programs get along well with Clean Slate
- Easily enable security for administrative logon
- Free technical support
- Saves you valuable time
- Removes your chore of re-imaging or cleaning a computer
- Be informed! Join the [Fortres Grand e-list](#) to be notified of software enhancements, patches, and upgrade

- Remotely update/upgrade Clean Slate installations.
- Disable computer security at scheduled times.
- Customize Clean Slate security based on computer, user or group.
- Disable Clean Slate remotely based on computer, user, or group.
- Restart, shut down, or log off remote computers.
- Builds on existing LDAP network users and groups.
- One configuration screen for two powerful security products: Fortres 101 and Clean Slate.
- User and group settings follow the user to any computer on the network.
- Centrally store and manage configuration files.
- Supports Windows Server 2012/2008/2003/2000 and can read users from any LDAP server.
