ABSTRACT

Personal histories organized by names, dates of birth, credit card numbers, driver's license numbers, bank account numbers, and social security numbers have a cyber immortality given the ease at which information can be transmitted and stored on databases. In response to the growth of efficient Digital Information Retrieval (D.I.R.) programs by which one's personal history can be accessed without one's knowledge or approval, Rykin Data has developed the methods in which a software-based application can source the total sum of one's personal information archived on all databases and permanently purge this data, effectively granting the subject a clean slate within the digital world.
