Autism Diagnosis Training Courses

ATT-Training is a service developed in collaboration with the Autism Treatment Trust to provide professionals and other interested individuals and organisations, access to a range of autism training courses, conferences and workshops. ATT-Training offers quality training for professionals to administer ADOS-2 and ADI-R for diagnosis purposes to the level of clinical reliability and optionally to research reliability. Training workshops in a range of cognitive and psychometric assessments are also available.

Vineland

Description

The Vineland Adaptive Behavior Scales, Second Edition (Vineland) is a well known assessment of daily living skills that is commonly used in educational, clinical and research setting. The scales measure four broad adaptive behaviour domains: Communication, Daily Living Skills, Socialisation and Motor Skills. It is administered through interviews or a rating scale for parents/caregivers and teachers. The four domain composite scores have all been standardised with a mean of 100 and a standard deviation of 15. The scales have been used to evaluate a range of disorders and disabilities such as mental retardation, Down Syndrome, ASD and other developmental delays. The Vineland scales have been found to be of benefit to improve ASD diagnosis accuracy, especially when the ADI-R and ADOS scores are not congruent. It is also of some use to follow the longitudinal progression of individuals across their lifespan.

Quick Facts

Administer To	Family or caregiver
Age range	Birth to 90 years old

C ATT Training	Log In	Sign Up	Visit
Formats	Questionnaire
