## Straight-Leg Test for Evaluating Low Back Pain

### Topic Overview

Save This Article For Later | Share this: | Font size: A A A

Straight-leg tests are done to help find the reason for low back and leg pain. To do this test, you lie on your back with both legs straight. Your health professional raises one of your legs upward, keeping the knee straight.

Your doctor may do this test on each leg. The test stretches the sciatic nerve that runs down the back of your leg and the nerve roots that lead to it.

❖ If you have pain down the back of your leg below the knee when your affected leg is raised, the test is positive (abnormal). It means that one or more of the nerve roots leading to your sciatic nerve may be compressed or irritated.

❖ If doing this test on the unaffected leg causes pain in the affected leg, it helps to confirm that one of these nerve roots is compressed or irritated.

Compression or irritation of the nerve roots leading to the sciatic nerve can have several causes, but the most common is a herniated disc at the lowest part of your back.

##### Managing Your Back Pain at Home

If you got up this morning and thought, "Ugh, my back hurts," you're not alone. About one in five Americans reports having experienced back pain at least once during the previous month. So, should you go to the doctor? Not necessarily. Most low back pain resolves on its own within about four to six weeks, with or without medical treatment. In many cases, you can manage your back pain at home. First, you should know when it's a bad idea to handle your back pain yourself. If you have significant...
