

Psychotropic Medications

Chapter 55.01 Definitions.

(6s) “Psychotropic medication” means a prescription drug, as defined in s. 450.01 (20), that is used to treat or manage a psychiatric symptom or challenging behavior.

Some psychotropic medications fall into specific medication classes like antipsychotics or antidepressants. In other cases, the medications may be primarily used for other diseases but have been found effective in controlling behaviors thus making that specific use a psychotropic medication.

Below is a list of psychotropic medications or medications with psychotropic uses. This list is not intended to be all-inclusive, however it can act as a resource to alert you to psychotropic medications where regulations like psychotropic monitoring, informed consent or guardianship may impact. If you have any questions about the medication, its intended use or adverse effects please contact the prescribing physician, pharmacist or nurse.
